iPhone 17 Pro and iPhone 17 Pro Max

Product Environmental Report

Date introduced
September 9, 2025

ARCHIVED

30% recycled content
in iPhone 17 Pro and iPhone 17 Pro Max[1]

40% of manufacturing electricity
is sourced from supplier renewable energy projects[2]

iPhone 17 Pro and iPhone 17 Pro Max are powered by recycled materials
with a battery containing 100% recycled cobalt and 95% recycled lithium

This report includes data current as of product launch. Product evaluations are based on U.S. configuration of iPhone 17 Pro and iPhone 17 Pro Max. Product carbon footprint calculations include in-box accessories as well as packaging.

Product Carbon and Material Footprint

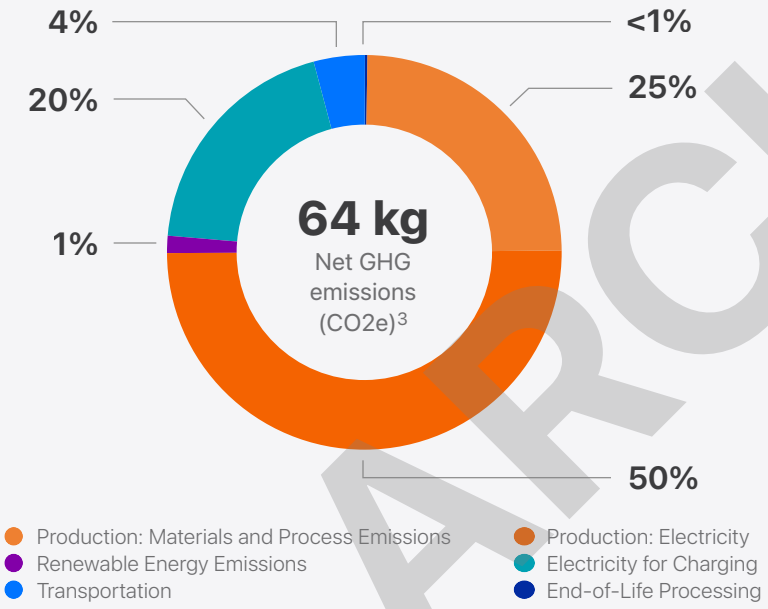

We're focused on decarbonizing the three largest sources of emissions—materials, electricity, and transportation—across our value chain. We're making progress by expanding our suppliers' sourcing of renewable energy—40 percent of manufacturing electricity for iPhone 17 Pro and iPhone 17 Pro Max was sourced from renewable energy projects.[2] We prioritize the use of recycled, renewable, and low-carbon materials while focusing on the energy efficiency of our software and hardware.

We've prioritized the responsible selection and sourcing of materials and components that make up a large part of our product carbon footprint. We work to recover as much as possible of our own scrap at high purity that meets our internal standards. Since recycled material typically emits less carbon than newly mined materials over its lifetime, we look to postindustrial and postconsumer sources for waste streams that can be recovered and used in new products.

ARCHIVED

iPhone 17 Pro

256GB

iPhone 17 Pro and iPhone 17 Pro Max

contains 30% recycled content,[1] including:

50% recycled **aluminum** in the enclosure

100% recycled **cobalt** in the battery

100% recycled **copper** in the vapor chamber enclosure

100% recycled **gold** plating and **tin** solder in all Apple-designed printed circuit boards

100% recycled **gold** wire in all cameras and Camera Control as well as gold plating in all connectors

95% recycled **lithium** in the battery

100% recycled **rare earth elements** in all magnets

80% recycled **steel** in the display support plate, speaker, and receiver

100% recycled **tungsten** and **copper** wire in the Taptic Engine

Product Insights

Water

Water is a local resource. For this reason, our water strategy is respectful of local conditions where we and our suppliers operate. We collect and analyze data and site-level feedback to make sure we understand our water impacts.

Our Supplier Clean Water program prioritizes high water users in high water stress locations and drives participants to an average 50 percent water reuse rate by 2030. Learn more ›

Package and Ship

The packaging is 100 percent fiber-based and uses only recycled or responsibly sourced fibers.[4] To transport multiple iPhone 17 Pro and iPhone 17 Pro Max at once, we designed smaller boxes. This reduces paper waste and carbon emissions as 25 percent more units can be shipped per trip.[5]

100% Fiber-based packaging[4]

Zero Waste to Landfill

No established final assembly supplier sites generate any waste sent to landfill.[6]

Safer Cleaners

All final assembly supplier sites are required to use safer cleaners and degreasers in their manufacturing processes, as determined by methodologies like ChemFORWARD, US EPA Safer Choice, or GreenScreen®.[7]

Learn more about the requirements in our Regulated Substances Specification.

Energy Efficiency

iPhone 17 Pro and iPhone 17 Pro Max use at least 55 percent less energy than the energy efficiency standard.[8]

55% less energy

Longevity

iPhone 17 Pro and iPhone 17 Pro Max feature Ceramic Shield 2, which has 3x better scratch resistance than the previous generation.

We redesigned the battery attachment to enable faster, simpler repairs. We've also enhanced our repair capabilities for the logic board and enclosure, enabling more discrete and targeted repair options. See repair options ›

Smarter Chemistry

All of the materials used in Apple products, accessories, and packaging are covered by the requirements of our Regulated Substances Specification, which was one of the first in the industry to restrict the use of key substances of concern. Apple continues to stand out from our industry peers through other substance restrictions and initiatives:

- Our Full Material Disclosure (FMD) program, which allows us to collect material and chemical data deep into our supply chain to support Apple initiatives and compliance
- Routine and robust toxicological assessments of all materials in prolonged skin contact to help minimize risk to customers under normal use conditions
- NGO partnerships to advance safer alternatives, including the identification of substitutes and improved access to chemical hazard data

To learn more, read A Protocol for Prioritizing Chemicals of Concern in the Electronics Industry and Integrating Toxicological Assessments in Material Selection for Apple Products.

People and Environment in Our Supply Chain

We require our suppliers to provide safe and healthy workplaces where people are treated with dignity and respect, and to reduce their environmental impact. From the strong foundation set by our Supplier Code of Conduct, we go further—from helping suppliers transition to clean electricity, to providing educational opportunities for their employees, to supporting final assembly suppliers in reducing waste.

Definitions

Carbon footprint: Estimated emissions are calculated in accordance with guidelines and requirements as specified by ISO 14040, ISO 14044, and ISO 14067. There is inherent uncertainty in modeling carbon emissions due primarily to data limitations. For the top component contributors to Apple's carbon emissions, Apple addresses this uncertainty by developing detailed process-based environmental models with Apple-specific parameters. For the remaining elements of Apple's carbon footprint, we rely on industry average data and assumptions. We calculate carbon emissions using the 100-year time horizon global warming potentials (GWP100) from the IPCC Sixth Assessment Report (AR6), including biogenic carbon. Our carbon footprint calculation includes emissions for the following life cycle phases in CO_2 equivalency (CO_2e):

- **Production:** Includes the extraction, processing, and transportation of raw materials, as well as the manufacture, transport, and assembly of all parts and product packaging.
- **Transport:** Includes ground, air, and sea transportation of the finished product and its associated packaging from manufacturing site to regional hubs and customers.
- **Use:** Apple assumes three years of use time for iPhone, Watch, and AirPods, and four years of use time for iPad, Mac, and other devices including Vision Pro and AppleTV. The total energy use over that period is based on use patterns of historically similar products calculated using data from a variety of sources including, but not limited to, field telemetry from users who opt-in to sharing device analytics and modeling battery drain from activities such as movie and music playback. Geographic differences in power grid mix is accounted for at a regional level. Measurement practices follow Apple's privacy practices and policies, which can be found on Apple's privacy website.
- **End-of-life processing:** Includes transportation from collection hubs to recycling centers and the energy used in mechanical separation and shredding of parts.

For more information on our product carbon footprint methodology, visit apple.com/environment/answers.

Low-carbon electricity: Refers to both renewable electricity as well as other fossil-free projects that Apple considers "low-carbon" but not "renewable," like nuclear and large-impact hydroelectricity projects, which may be included as a result of low-carbon electricity provided by the grid. Apple accounts for the carbon impact of building and operating these projects, and so considers them to be low-carbon but not zero-carbon.

Low-carbon materials: Refers to materials created using production techniques with reduced carbon impact, such as Elysis (a patented technology that eliminates direct greenhouse gas emissions from the traditional aluminum smelting process) or aluminum smelted using hydroelectricity instead of coal.

Paper: Our definition of paper is adapted from ISO 4046 to cover materials in the form of a coherent sheet or web made by deposition of fibers from a fluid suspension onto a suitable forming device, with or without the addition of other substances.

Recycled materials: Recycling makes better use of finite resources by sourcing from recovered rather than mined or primary materials. The recycled content of materials used in our products has been verified by an independent third party to a recycled content standard that conforms to ISO 14021 definitions.

Renewable materials: We define bio-materials as those that can be regenerated in a human lifespan, like wood fibers or sugarcane. Bio-materials can help us use fewer finite resources. But even though bio-materials have the ability to regrow, they are not always managed responsibly. Renewable materials are a type of bio-material managed in a way that enables continuous production without depleting the earth's resources. That's why we focus on sources that are certified for their responsible management practices.

Supplier Clean Energy Program: Since the electricity used to make our products is the largest contributor to our overall carbon footprint, we're helping our suppliers decarbonize their Apple production, including by transitioning electricity use to 100 percent renewable sources.

ARCHIVED

Carbon Footprint

Greenhouse gas emissions were calculated using a life cycle assessment (LCA) methodology in accordance with ISO 14040, ISO 14044, and ISO 14067 standards. The LCA boundary for this product includes the physical product and all of its components and packaging, as well as all in-box accessories.

We've calculated the product carbon footprint for the following configurations.

Configuration	iPhone 17 Pro	iPhone 17 Pro Max
256GB	64 kg CO_2e	67 kg CO_2e
512GB	74 kg CO_2e	77 kg CO_2e
1TB	93 kg CO_2e	95 kg CO_2e
2TB	—	134 kg CO_2e

We model different configurations of our products to show the potential range of carbon emissions. There is inherent uncertainty in modeling carbon emissions due primarily to data limitations. For the top component contributors to Apple's carbon emissions, Apple addresses this uncertainty by developing detailed process-based environmental models with Apple-specific parameters. For the remaining elements of Apple's carbon footprint, we rely on industry-average data and assumptions.

For more information on our product carbon footprint methodology, visit apple.com/environment/answers.

Recover

Apple Trade In offers customers a seamless way to return their old devices and accessories to Apple. Eligible devices can be traded in for credit or an Apple Store Gift Card, while accessories and other devices can be recycled for free.[9] We also offer and participate in product take-back and recycling collection programs for 99 percent of the countries where we sell products—and we hold our recyclers to high standards. Learn more at apple.com/recycle.

Endnotes

1 Product recycled or renewable content is the mass of certified recycled material relative to the overall mass of the device, not including packaging or in-box accessories.

2 We estimate the percentage of electricity-related emissions in our manufacturing that is sourced from low-carbon electricity by attributing to our carbon model low-carbon energy procured by our suppliers in the prior fiscal year, based on the supplier manufacturing allocations at time of product launch. This calculation assesses the suppliers for iPhone 17 Pro and iPhone 17 Pro Max. Included in this number is only low-carbon electricity that Apple or its suppliers have procured as part of Apple's Supplier Clean Energy Program.

3 Greenhouse gas emissions were calculated using a life cycle assessment methodology in accordance with ISO 14040, 14044, and 14067 standards. The life cycle assessment boundary for this product includes the physical product and all of its components and packaging, as well as all in-box accessories.

4 Breakdown of U.S. retail packaging by weight. Adhesives, inks, and coatings are excluded from our calculations of plastic content and packaging weight. Fiber sourcing requirements are defined in Apple's Responsible Fiber Specification. We consider wood fibers to include bamboo.

5 Based on the number of 10-unit boxes that fit onto a pallet compared to iPhone 16 Pro. The following locations have different savings based on various pallet configurations: Andorra, Canada, Cyprus, Greece, Italy, Portugal, South Korea, Spain, Switzerland, U.S.

6 All established final assembly supplier sites—those that have been Apple suppliers for more than one year—for iPhone 17 Pro and iPhone 17 Pro Max are third-party verified as Zero Waste by UL LLC (UL 2799 Standard). UL requires at least 90 percent diversion through methods other than waste to energy to achieve Zero Waste to Landfill (Silver 90–94 percent, Gold 95–99 percent, and Platinum 100 percent) designations.

7 Chemicals that meet ChemFORWARD Hazard band C or better, except for x/c-CMR(2), or equivalent results from other methodologies like GreenScreen or U.S. EPA Safer Choice are considered safer and preferred for use. ChemFORWARD, GreenScreen®, and Safer Choice are comprehensive hazard assessment tools that evaluate substances against multiple human health, environmental, and physical endpoints.

8 Efficiency performance is based on the U.S. Department of Energy Federal Energy Conservation Standards for Battery Chargers. Please note that ENERGY STAR does not certify smartphone devices. Energy efficiency terms: The energy efficiency values are based on the following conditions.

Power adapter, no-load: Condition in which the Apple 20W USB-C Power Adapter with the USB-C Charge Cable (1m) is connected to AC power, but not connected to iPhone.

Power adapter efficiency: Average of the 20W USB-C Power Adapter with the USB-C Charge Cable (1 m) measured efficiency when tested at 100 percent, 75 percent, 50 percent, and 25 percent of the power adapter's rated output current.

Power consumption for iPhone 17 Pro and iPhone 17 Pro Max

Mode	100V	115V	230V
Power adapter, no-load	0.04W	0.04W	0.04W
Power adapter efficiency	87.49%	88.06%	87.81%

9 Trade-in values vary based on the condition, year, and configuration of your trade-in device, and may also vary between online and in-store trade-in. You must be at least 18 years old. In-store trade-in requires presentation of a valid, government-issued photo ID (local law may require saving this information). Additional terms from Apple or Apple's trade-in partners may apply.
